Amendments to the Abstract

Please **add** the following Abstract to this application.

~~Each network device (x) of the system has a local representation of the community to which it belongs by containing:~~
~~a provable identity (id$_x$) or means to generate or to obtain a provable identity;~~
~~objects (MT(x), UT(x), DT(x)) capable of memorizing identities of devices of the community having trust relationships with said device; and~~
~~means for establishing a protocol for trust relationships synchronization.~~

-- A new system for creating and updating a secure community of devices in digital networks is disclosed. A device adapted to belong to a community of networked devices contains: a provable identity and/or means for generating and/or obtaining a provable identity; means adapted to store information about devices of the community having trust relationships with the device; means adapted to store information about devices not trusted by this device; and means for trust relationships synchronization.--
